on transformed advantage selective confer ribitol which arabitol,

Page 34-35; 37pp; English. Claim 1;

The present invention relates to a positive selection system that involves conferring to transferred cells the ability to metabolise arabitol, ribitol and/or mannitol. The positive selection method is used in positively selecting transgenic cells from a population of cells using the positive selection method, the presence of the gene of interest in the genetically transformed cells may be determined with traditional negative selection systems. Positive selection of the transformed cells is achieved without directly damaging the neighbouring non-transformed cells. The transformed cells may be identified by simple visual means without the use of a separate assay to determine the presence of a marker gene. This technique also avoids the release of antibiotics or other dangerous genes in the dangerous genes dangerous genes dangerous genes dangerous genes dangerous genes dangerous genes d gene. arabitol dehydrogenase strain C

2000-587530/55 P-PSDB; AAB23172 Gluconobacter oxydans derived D-sorbitol dehydrogenase obtainable by culturing list gene-transformed host cells, useful for producing L-sorbose or 2-keto-L-gluconic acid as an intermediate in L-ascorbic acid production

9; Page 60-63; 72pp; Japanese. Claim

The invention relates to Gluconobacter oxydans D'-sorbitol dehydrogenase (SLDH; AAB3172) and to the gene encoding it (AAA97430). SLDH has a molecular weight of about 54 kba and catalyses the conversion of D-sorbitol into L-sorbose using NADP+ as a co-enzyme. SLDH specifically catalyses the oxidation of sorbitol, mannitol and arabitol, but does not encompasses expression vectors and host cells comprising the encompasses expression vectors and host cells comprising the Gluconobacter oxydans SLDH gene, and the recombinant production of SLDH. contacting the recombinant SLDH with D-sorbitol; a process for producing 2-keto-L-gluconic acid by contacting recombinantly produced sorbose dehydrogenase and/or sorbosene dehydrogenase with L-sorbose; and a process for preparing L-ascorbic acid or its alkaline earth metals salts by conversion from 2-keto-L- gluconic acid. SLDH is useful for producing L-sorbose or 2-keto-L- gluconic acid as an intermediate in L-ascorbic the Gluconobacter production. The present sequence represents SLDH gene.

The present sequence encodes Gluconobacter suboxydans L-sorbose reductase.

N.B. This patent is equivalent to the basic NO9901197 in week 199949.
                                                                                                              Gluconobacter suboxydans; L-sorbose reductase; genetic engineering;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              725 AGCTCAACGAAGCCAGTGGCCTGCACGACGACGACGACGTGCAGAAGACTTTCATC

AAZ32000 and AAZ32001 encode, and AAY49501 and AAY49502 represent, human metalloprotease thrombospondin (METH) proteins METH1 and METH2 respectively. METH1 and METH2 have been found to be potent inhibitors of anglogenesis both in vitro and in vivo. They can be used for treating cancer and other disorders related to angiogenesis including abnormal wound healing, inflammation, rheumatoid arthritis, psoriasis,

endometrial bleeding disorders, diabetic retinopathy, some forms of macula degeneration, haemangiomas, and arterial venous malformations. They may be useful in treating deficiencies or disorders of the immune system, by activating or inhibiting the proliferation, differentiation, or mobilisation (chemotaxis) of immune cells. The etiology of these immune deficiencies or disorders may be genetic, somatic, such as cancer or some autoimmune disorders, acquired (e.g. by chemotherapy or toxins), or infectious. They can also be used to treat inflammatory conditions, both chronic and acute conditions. The products can also be used for detection and diagnosis. AAZ12002 to AAZ32080, and AAX49503 to AAX49511 represent sequences given in the exemplification of the present
                                                                                                                                                                                                                                                                                                                                               invention.

The present invention relates to human METH1 and METH2, (ME for metalloprotease and TH for thrombospondin; see AAB50002 and AAB50003). The present sequence is an expressed sequence tag (EST) for METH. METH can be used for inhibiting anglogenesis in an individual, and for treating cancer, benign tumours, an ocular anglogenic disease, rheumatoid arthritis, psoriasis, delayed wound healing, endometriosis, vasculogenesis, granulations, hypertrophic scars, nonunion fractures, scleroderma, trachoma, vascular adhesions, myocardial anglogenesis,
                                                                                                                                                                                                                                         cancer therapy; benign tumour; ocular anglogenic disease; rheumatoid arthritis; psoriasis; wound healing; endometriosis; vasculogenesis; granulation; hypertrophic scar; nonunion fracture; scleroderma, trachoma; vascular adhesion; myocardial anglogenesis; coronary collateral; cerebral collateral; arteriovenous malformation; lischaemic limb anglogenesis; Osler-Webber syndrome; wound granulation; plaque neovascularisation; telangiectasia; haemophiliac joint; EST; anglofibroma; fibromuscular dysplasia; expressed sequence tag; crohn's disease; atherosclerosis; birth control; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   oded polypeptides, used to
disorders such as cancer,
